

(Revised January 1, 2017)

An NHSN operative procedure is a procedure:

- That is included in the **ICD-10-PCS** or **CPT** NHSN operative procedure code mapping
- AND**
- Takes place during an operation where at least **ONE** **△** of the following:
 - △** incision (including laparoscopic approach and cranial Burr holes) is made through the skin or mucous membrane
 - △** reoperation via an incision that was left open during a prior operative procedure
- AND**
- Takes place in an operation room [OR] **

** Defined as a patient care area that met the Facilities Guidelines Institute's (FGI) or American Institute of Architects' (AIA) criteria for an operating room when it was constructed or renovated. This may include an operating room, C- section room, interventional radiology room, or a cardiac catheterization lab.

Exclusions: Otherwise eligible procedures that are assigned an ASA score of 6 are not eligible for NHSN SSI Surveillance.

Note: Incisional closure method is NOT a part of the NHSN operative procedure definition; all otherwise eligible procedures are included, regardless of closure type. Therefore both primarily closed procedures and those that are not closed primarily should be entered into the denominator data for procedures in the facility's monthly reporting plan. Any SSIs attributable to either primarily closed or non-primarily closed procedures should be reported.

ASA physical status: Assessment by the anesthesiologist of the patient's preoperative physical condition using the American Society of Anesthesiologists' (ASA) Classification of Physical Status. Patient is assigned one of the following:

1. A normally healthy patient
2. A patient with mild systemic disease
3. A patient with severe systemic disease
4. A patient with severe systemic disease that is a constant threat to life
5. A moribund patient who is not expected to survive without the operation.

NOTE: Do NOT report procedures with an ASA physical status of 6 (a declared brain-dead patient whose organs are being removed for donor purposes) to NHSN.

SURGICAL SITE INFECTION (SSI)

Date of Event (DOE): For an SSI the date of event is the date when the first element used to meet the SSI infection criterion occurs for the first time during the surveillance period. The date of event must fall within the SSI surveillance period to meet SSI criteria. Synonym: infection date.

Diabetes: The NHSN SSI surveillance definition of diabetes indicates that the patient has a diagnosis of diabetes requiring management with insulin or a non-insulin anti-diabetic agent. This includes patients with “insulin resistance” who are on management with anti-diabetic agents. This also includes patients with a diagnosis of diabetes who are noncompliant with their diabetes medications. The ICD-10-CM diagnosis codes that reflect the diagnosis of diabetes are also acceptable for use to answer YES to the diabetes field question on the denominator for procedure entry. These codes are found on the NHSN website in the SSI section “Supporting Materials”. The NHSN definition excludes patients with no diagnosis of diabetes. The definition excludes patients who receive insulin for perioperative control of hyperglycemia but have no diagnosis of diabetes.

Duration Of Operative Procedure: The interval in hours and minutes between the Procedure/Surgery Start Time, and the Procedure/Surgery Finish Time, as defined by the Association of Anesthesia Clinical Directors (AACD):

- **Procedure/Surgery Start Time (PST):** Time when the procedure is begun (e.g., incision for a surgical procedure).
- **Procedure/Surgery Finish (PF):** Time when all instrument and sponge counts are completed and verified as correct, all postoperative radiologic studies to be done in the OR are completed, all dressings and drains are secured, and the physicians/surgeons have completed all procedure-related activities on the patient.

Emergency Operative Procedure: A procedure that is documented per the facilities protocol to be an Emergency or Urgent procedure.

General Anesthesia: The administration of drugs or gases that enter the general circulation and affect central nervous system to render the patient pain free, amnesic, unconscious, and often paralyzed with relaxed muscles. This does not include conscious sedation.

Height: The patient’s most recent height documented in the medical record in feet (ft.) and inches (in), or meters (m).

NHSN Inpatient Operative Procedure: An NHSN operative procedure performed on a patient whose date of admission to the healthcare facility and the date of discharge are different calendar days.

NHSN Outpatient Operative Procedure: An NHSN operative procedure performed in an Ambulatory Surgery Center, Hospital Outpatient department, or a procedure performed on a patient whose date of admission to the healthcare facility and the date of discharge are same calendar day.

SURGICAL SITE INFECTION (SSI)

Non-Primary Closure: is defined as closure of the surgical wound in a way which leaves the skin level completely open following the surgery. Closure of any portion of the skin represents primary closure (see below). For surgeries with non-primary closure, the deep tissue layers may be closed by some means (with the skin level left open), or the deep and superficial layers may both be left completely open. An example of a surgery with non-primary closure would be a laparotomy in which the incision was closed to the level of the deep tissue layers, sometimes called “fascial layers” or “deep fascia,” but the skin level was left open. Another example would be an “open abdomen” case in which the abdomen is left completely open after the surgery. Wounds with non-primary closure may or may not be described as “packed” with gauze or other material, and may or may not be covered with plastic, “wound vacs,” or other synthetic devices or materials.

Primary closure: is defined as closure of the skin level during the original surgery, regardless of the presence of wires, wicks, drains, or other devices or objects extruding through the incision. This category includes surgeries where the skin is closed by some means. Thus, if any portion of the incision is closed at the skin level, by any manner, a designation of primary closure should be assigned to the surgery.

NOTE: If a procedure has multiple incision/laparoscopic trocar sites and any of the incisions are closed primarily then the procedure technique is recorded as primary closed.

Scope: An instrument used to visualize the interior of a body cavity or organ. In the context of an NHSN operative procedure, use of a scope involves creation of several small incisions to perform or assist in the performance of an operation rather than use of a traditional larger incision (i.e., open approach). Robotic assistance is considered equivalent to use of a scope for NHSN SSI surveillance. See also [Instructions for Completion of Denominator for Procedure](#) Form and both Numerator Data and Denominator Data reporting instructions in the [NHSN Patient Safety Manual](#).

ICD-10-PCS codes can be helpful in answering the scope question. The fifth character indicates the approach to reach the procedure site. A value of zero (0) as the fifth character represents an open approach, and a value of four (4) as the fifth character represents a percutaneous endoscopic approach. If the fifth character of the ICD-10-PCS code is a four (4) then the field for scope can be YES.

NOTE: According to ICD-10-PCS code rules, if a trocar site is extended, it will be coded as an open approach, therefore scope will be no.

Secondary BSI Attribution Period: The secondary BSI attribution period for SSI is a 17-day period that includes the date of event, 3 days prior and 13 days after. For detailed instructions on determining whether identification of an organism from a blood specimen represents a secondary BSI, refer to the Secondary BSI Guide checklist.

SURGICAL SITE INFECTION (SSI)

Trauma: Blunt or penetrating injury occurring prior to the start of the procedure.

Weight: The patient's most recent weight documented in the medical record in pounds (lbs) or kilograms (kg) prior to or otherwise closest to the procedure.

Wound Class: An assessment of the degree of contamination of a surgical wound at the time of the operation. Wound class should be assigned by a person involved in the surgical procedure, (e.g., surgeon, circulating nurse, etc.). The wound class system used in NHSN is an adaptation of the American College of Surgeons wound classification schema.

Wounds are divided into four classes:

Clean: An uninfected operative wound in which no inflammation is encountered and the respiratory, alimentary, genital, or uninfected urinary tracts are not entered. In addition, clean wounds are primarily closed and, if necessary, drained with closed drainage. Operative incisional wounds that follow non-penetrating (blunt) trauma should be included in this category if they meet the criteria.

NOTE: The clean wound classification level will not be available for the following NHSN operative procedure categories: APPY, BILI, CHOL, COLO, REC, SB, and VHYS. For all other procedures clean is available as a choice e.g. CSEC, HYST, or OVRY can be clean if documented as such.

Clean-Contaminated: Operative wounds in which the respiratory, alimentary, genital, or urinary tracts are entered under controlled conditions and without unusual contamination. Specifically, operations involving the biliary tract, appendix, vagina, and oropharynx are included in this category, provided no evidence of infection or major break in technique is encountered.

Contaminated: Open, fresh, accidental wounds. In addition, operations with major breaks in sterile technique (e.g., open cardiac massage) or gross spillage from the gastrointestinal tract, and incisions in which acute, non-purulent inflammation is encountered including necrotic tissue without evidence of purulent drainage (e.g., dry gangrene) are included in this category.

Dirty or Infected: Includes old traumatic wounds with retained devitalized tissue and those that involve existing clinical infection or perforated viscera. This definition suggests that the organisms causing postoperative infection were present in the operative field before the operation.

Superficial Incisional Surgical Site Infection*(Revised January 1, 2017)***DEFINITION:** A superficial incisional SSI must meet the following criterion:**□ Criterion 1:**

- Date of event for infection occurs within 30 days after any NHSN operative procedure (where day 1 = the procedure day),

AND

- Infection involves only skin and subcutaneous tissue of the incision

AND

- Patient has at least **ONE** **△** of the following:

- △** purulent drainage from the superficial incision

- △** organisms identified from an aseptically-obtained specimen of **ONE** **◇** of the following:

- ◇** superficial incision[#]

- ◇** subcutaneous tissue[#]

- △** must meet **THREE** **◇** occurrences:

- ◇** superficial incision is deliberately opened by surgeon, attending physician** or other designee

- ◇** culture or non-culture based testing is not performed

- ◇** patient has at least **ONE** **+** of the following signs or symptoms:

- +** pain or tenderness

- +** localized swelling

- +** erythema

- +** heat

- △** diagnosis of superficial incisional SSI by the surgeon or attending physician** or other designee

<http://www.cdc.gov/nhsn/xls/cpt-pcm-nhsn.xlsx>

<http://www.cdc.gov/nhsn/xls/icd10-pcs-pcm-nhsn-opc.xlsx>

****The term attending physician for the purposes of application of the NHSN SSI criteria may be interpreted to mean the surgeon(s), infectious disease, other physician on the case, emergency physician or physician's designee (nurse practitioner or physician's assistant).**

#by a culture or non-culture based microbiological testing method which is performed for purposes of clinical diagnosis or treatment (e.g., not Active Surveillance Culture/Testing (ASC/AST).

COMMENTS:

There are two specific types of superficial incisional SSIs:

1. Superficial Incisional Primary (SIP) – a superficial incisional SSI that is identified in the primary incision in a patient that has had an operation with one or more incisions (e.g., C-section incision or chest incision for CBGB).
2. Superficial Incisional Secondary (SIS) – a superficial incisional SSI that is identified in the secondary incision in a patient that has had an operation with more than one incision (e.g., donor site incision for CBGB).

REPORTING INSTRUCTIONS: (Revised January 1, 2017)

The following do not qualify as criteria for meeting the NHSN definition of superficial SSI:

- Diagnosis/treatment of cellulitis (redness/warmth/swelling), by itself, does not meet the **LAST**  criterion for Superficial Incisional SSI. Conversely, an incision that is draining or that has organisms identified by culture or non-culture based testing is not considered a cellulitis.
- A stitch abscess alone (minimal inflammation and discharge confined to the points of suture penetration).
- A localized stab wound or pin site infection-Such an infection might be considered either a skin (SKIN) or soft tissue (ST) infection, depending on its depth, but not an SSI.

Note: a laparoscopic trocar site for an NHSN operative procedure is not considered a stab wound.

- Circumcision is not an NHSN operative procedure. An infected circumcision site in newborns is classified as CIRC and is not an SSI.
- An infected burn wound is classified as a BURN and is not an SSI.

Deep incisional surgical site infection*(Revised January 1, 2017)***DEFINITION:** A deep incisional SSI must meet the following criteria:**□ Criterion 1:**

- Date of event for infection occurs within **30 or 90 days** after the NHSN operative procedure (where day 1 = the procedure day) according to the table below titled “Surveillance Period for Deep Incisional or Organ/Space SSI Following Selected NHSN Operative Procedure Categories.”

AND

- involves deep soft tissues of the incision (e.g. fascial and muscle layers).

AND

- Patient has at least **ONE** **△** of the following:
 - △** purulent drainage from the deep incision
 - △** must meet **ALL** **◇** of the following:
 - ◇** choose **ONE** **+** of the following:
 - +** a deep incision that spontaneously dehisces and organism is identified[#] or culture or non-culture based microbiologic testing method is not performed.
 - +** a deep incision deliberately opened by a surgeon, attending physician** or other designee and organism is identified[#] or culture or non-culture based microbiologic testing method is not performed.
 - +** aspirated by a surgeon, attending physician** or other designee and organism is identified[#] or culture or non-culture based microbiologic testing method is not performed.
 - ◇** patient has at least **ONE** **+** of the following signs or symptoms:
 - +** fever (>38°C)
 - +** localized pain or tenderness

NOTE: A culture or non-culture based test that has a negative finding does not meet this criterion

△ choose **ONE** ◇ of the following:

◇ an abscess involving the deep incision that is detected **ONE** + of the following:

- + gross anatomical exam
- + histopathologic examination
- + imaging test

◇ other evidence of infection involving the deep incision that is detected on **ONE** + of the following:

- + gross anatomical exam
- + histopathologic examination
- + imaging test

*The term “attending physician” for the purposes of application of the NHSN SSI criteria may be interpreted to mean: the surgeon(s), infectious disease, other physician on the case, emergency physician, or physician’s designee (nurse practitioner or physician’s assistant).

#by a culture or non-culture based microbiological testing method which is performed for purposes of clinical diagnosis or treatment (e.g., not Active Surveillance Culture/Testing (ASC/AST)).

COMMENTS:

There are two specific types of deep incisional SSIs:

1. Deep Incisional Primary (DIP) – a deep incisional SSI that is identified in a primary incision in a patient that has had an operation with one or more incisions (e.g., C-section incision or chest incision for CBGB).
2. Deep Incisional Secondary (DIS) – a deep incisional SSI that is identified in the secondary incision in a patient that has had an operation with more than one incision (e.g., donor site incision for CBGB).

ORGAN/SPACE – Organ/Space Surgical Site Infection*(Revised January 1, 2017)***DEFINITION:** An organ/space SSI must meet the following criteria:**□ Criterion 1:**

- Patient has **ONE** **△** of the following:

- △ Date of event for** infection occurs within **30 days** after the NHSN operative procedure (where day 1 = the procedure date) according to the “30-day Surveillance” portion of the table below titled “Surveillance Period for Deep Incisional or Organ/Space SSI Following selected NHSN Operative Procedure Categories”.

- △ Date of event for** infection occurs within **90 days** after the NHSN operative procedure (where day 1 = the procedure date) according to the “90-day Surveillance” portion of the table below titled “Surveillance Period for Deep Incisional or Organ/Space SSI Following selected NHSN Operative Procedure Categories”.

AND

- infection involves any part of the body deeper than the fascial/muscle layers, that is opened or manipulated during the operative procedure.

AND

- Patient has at least **ONE** **△** of the following:

- △** purulent drainage from a drain that is placed into the organ/space (e.g., closed suction drainage system, open drain, T-tube drain, CT guided drainage).

- △** organisms are identified from an aseptically obtained of **ONE** **◇** of the following:

- ◇** fluid in the organ/space[#]

- ◇** tissue in the organ/space[#]

- △** choose **ONE** **◇** of the following:

- ◇** an abscess detected during **ONE** **+** of the following:

- +** gross anatomical exam

- +** histopathologic examination

- +** imaging test suggestive of infection

SURGICAL SITE INFECTION (SSI)

- ◇ other evidence of infection involving the organ/space detected during **ONE +** of the following:
 - + gross anatomical exam
 - + histopathologic examination
 - + imaging test suggestive of infection

AND

- Patient meets at least one of the criteria for a specific organ/space infection site listed in the table *titled “Specific Sites of an Organ/Space SSI”* (found towards the end of this checklist). These criteria are in the [Surveillance Definitions for Specific types of Infections](#) chapter of the NHSN protocol and corresponding checklist.

#by a culture or non-culture based microbiological testing method which is performed for purposes of clinical diagnosis or treatment (e.g., not Active Surveillance Culture/Testing (ASC/AST)).

SURGICAL SITE INFECTION (SSI)

(Revised January 1, 2017)

NOTE: Superficial incisional SSIs are only followed for a 30-day period for all procedure types.

Table Surveillance Periods for SSI Following Selected NHSN Operative Procedure Categories. Day 1 = the date of the procedure.

| 30-day Surveillance | | | |
|---------------------|---|------|------------------------------------|
| Code | Operative Procedure | Code | Operative Procedure |
| AAA | Abdominal aortic aneurysm repair | LAM | Laminectomy |
| AMP | Limb amputation | LTP | Liver transplant |
| APPY | Appendix surgery | NECK | Neck surgery |
| AVSD | Shunt for dialysis | NEPH | Kidney surgery |
| BILI | Bile duct, liver or pancreatic surgery | OVRY | Ovarian surgery |
| CEA | Carotid endarterectomy | PRST | Prostate surgery |
| CHOL | Gallbladder surgery | REC | Rectal surgery |
| COLO | Colon surgery | SB | Small bowel surgery |
| CSEC | Cesarean section | SPLE | Spleen surgery |
| GAST | Gastric surgery | THOR | Thoracic surgery |
| HTP | Heart transplant | THYR | Thyroid and/or parathyroid surgery |
| HYST | Abdominal hysterectomy | VHYS | Vaginal hysterectomy |
| KTP | Kidney transplant | XLAP | Exploratory Laparotomy |
| 90-day Surveillance | | | |
| Code | Operative Procedure | | |
| BRST | Breast surgery | | |
| CARD | Cardiac surgery | | |
| CBGB | Coronary artery bypass graft with both chest and donor site incisions | | |
| CBGC | Coronary artery bypass graft with chest incision only | | |
| CRAN | Craniotomy | | |
| FUSN | Spinal fusion | | |
| FX | Open reduction of fracture | | |
| HER | Herniorrhaphy | | |
| HPRO | Hip prosthesis | | |
| KPRO | Knee prosthesis | | |
| PACE | Pacemaker surgery | | |
| PVBY | Peripheral vascular bypass surgery | | |
| VSHN | Ventricular shunt | | |

SURGICAL SITE INFECTION (SSI)

Criteria for these sites can be found in the NHSN Help System (must be logged in to NHSN), in the [Surveillance Definitions](#) chapter of the 2017 NHSN Patient Safety Manual, or corresponding checklist.

Table Specific Sites of an Organ/Space SSI.

| Code | Site | Code | Site |
|------|---|------|---|
| BONE | Osteomyelitis | MED | Mediastinitis |
| BRST | Breast abscess or mastitis | MEN | Meningitis or ventriculitis |
| CARD | Myocarditis or pericarditis | ORAL | Oral cavity (mouth, tongue, or gums) |
| DISC | Disc space | OREP | Other infections of the male or female reproductive tract |
| EAR | Ear, mastoid | PJI | Periprosthetic Joint Infection |
| EMET | Endometritis | SA | Spinal abscess without meningitis |
| ENDO | Endocarditis | SINU | Sinusitis |
| GIT | GI tract | UR | Upper respiratory tract |
| IAB | Intraabdominal, not specified | USI | Urinary System Infection |
| IC | Intracranial, brain abscess or dura | VASC | Arterial or venous infection |
| JNT | Joint or Bursa | VCUF | Vaginal cuff |
| LUNG | Other infections of the lower respiratory tract | | |

SSI EVENT REPORTING INSTRUCTIONS: (Revised January 1, 2017)

- 1. Excluding organisms:** Organisms belonging to the following genera cannot be used to meet any NHSN definition: *Blastomyces*, *Histoplasma*, *Coccidioides*, *Paracoccidioides*, *Cryptococcus* and *Pneumocystis*. These organisms are typically causes of community-associated infections and are rarely known to cause healthcare-associated infections, and therefore are excluded.
- 2. Attributing SSI to an NHSN procedure when there is evidence of infection at the time of the primary surgery:** The Present on Admission (POA) definition does not apply to the SSI protocol. If evidence of infection is present at the time of the procedure and the patient meets the NHSN SSI criteria during the SSI surveillance period, an SSI is attributed to the procedure (see PATOS below). A high wound class is not exclusion for a patient later meeting criteria for an SSI, but in most cases is included as a risk factor for SSI in risk modeling.
- 3. Infection present at time of surgery (PATOS):** PATOS denotes that there is evidence of an infection or abscess at the start of or during the index surgical procedure (in other words, it is present preoperatively). PATOS is a YES/NO field on the SSI Event form. PATOS does not apply if there is a period of wellness between the time of a preoperative condition and surgery. The evidence of infection or abscess must be noted/documented intraoperatively in an operative note or report of surgery. Only select PATOS = YES if it applies to the depth of SSI that is being attributed to the procedures (e.g., if a patient has evidence of an intraabdominal infection at the

SURGICAL SITE INFECTION (SSI)

time of surgery and then later returns with an organ space SSI the PATOS field would be selected as a YES. If the patient returned with a superficial or deep incisional SSI the PATOS field would be selected as a NO). The patient does not have to meet the NHSN definition of an SSI at the time of the primary procedure, but there must be notation that there is evidence of an infection or abscess present at the time of surgery. PATOS is not necessarily diagnosis driven.

- a. The use of the ending “-itis” in an operative note/report does not necessarily meet PATOS, as it may reflect inflammation which is not infectious in nature (e.g., diverticulitis, peritonitis, and appendicitis).
- b. Identification of an organism **alone** using culture or non-culture based microbiologic testing method or on a pathology report from surgical specimen does not = PATOS (i.e., a positive culture/path report without surgical documentation of infection is not PATOS = yes).
- c. The following verbiage alone without specific mention of infection does not meet the PATOS definition: colon perforation, necrosis, gangrene, fecal spillage, nicked bowel during procedure, or a note of inflammation.
- d. Fresh traumas resulting in a contaminated case do not necessarily meet PATOS requirement. For example, a fresh gunshot wound to the abdomen will be a trauma case with a high wound class but there would not have been time for infection to develop.
- e. PATOS can be met when an abscess is noted, there is mention of infection in the OR note, purulence or pus is noted; feculent peritonitis is noted, etc. An infected appendix that has ruptured will meet PATOS = YES, if the patient has a subsequent intraabdominal organ space SSI.

Example 1: Patient admitted with an acute abdomen. Sent to OR for an XLAP where there is a finding of an abscess due to ruptured appendix and an APPY is performed. Patient returns two weeks later and meets criteria for an organ space IAB SSI. The PATOS field would be selected as YES on the SSI event since an abscess was noted at the time of surgery in the same level as the subsequent SSI.

Example 2: Patient is admitted with a ruptured diverticulum. In the OR note the surgeon documents that there are multiple abscesses in the intraabdominal cavity. Patient returns three weeks later and meets criteria for a superficial SSI. The PATOS field would be selected as NO since there was no documentation of evidence of infection or abscess of the superficial area at the time of the procedure.

Example 3: During an unplanned cesarean section (CSEC) the surgeon nicks the bowel and there is contamination of the intraabdominal cavity. One week later the patient returns and meets criteria for an organ/ space OREP (other reproductive) SSI. The PATOS field would be selected as NO since there was no documentation of evidence of infection or

SURGICAL SITE INFECTION (SSI)

abscess at the time of the CSEC. The colon nick was a complication but there was no infection present at the time of surgery.

Example 4: Patient undergoes a foot amputation (AMP) due to “dry-gangrene” of the foot from chronic ischemia. There is no evidence of infection at the time of surgery. The word gangrene is not sufficient to qualify for infection. The patient returns two weeks later and has a superficial SSI. The PATOS field would be selected as NO since there was no documentation of evidence of infection or abscess at the time of AMP-amputation.

- 4. Multiple tissue levels are involved in the infection:** The type of SSI (superficial incisional, deep incisional, or organ/space) reported should reflect the deepest tissue layer involved in the infection during the surveillance period. The date of event should be the date that the patient met criteria for the deepest level of infection:
- Report infection that involves the organ/space as an organ/space SSI, whether or not it also involves the superficial or deep incision sites.
 - Report infection that involves the superficial and deep incisional sites as a deep incisional SSI.
 - If an SSI started as a deep incisional SSI on day 10 of the SSI surveillance period and then a week later, (day 17 of the SSI surveillance period) meets criteria for a organ space SSI the date of event would be the date the of organ space SSI.
- 5. Reporting of SSI after a non-primary closure:** If a patient develops an SSI after a non-primary closure it should be attributed to that procedure if it meets criteria for an SSI within the appropriate surveillance period.
- 6. Attributing SSI to a NHSN procedure when several are performed on different dates:** If a patient has several NHSN operative procedures performed on different dates prior to an infection, attribute the SSI to the operative procedure that was performed most closely in time prior to the infection date, unless there is evidence that the infection was associated with a different operation.

NOTE: For multiple NHSN operative procedures performed within a 24-hour period, see the Denominator Reporting Instruction #9.

- 7. Attributing SSI to NHSN procedures that involve multiple primary incision sites:** If multiple primary incision sites of the same NHSN operative procedure become infected, only report as a single SSI, and assign the type of SSI (superficial incisional, deep incisional, or organ/space) that represents the deepest tissue level involved at any of the infected sites. For example:
- If one laparoscopic incision meets criteria for a superficial incisional SSI and another meets the criteria for a deep incisional SSI, only report one deep incisional SSI.

SURGICAL SITE INFECTION (SSI)

- b. If one or more laparoscopic incision sites meet criteria for superficial incisional SSI but the patient also has an organ/space SSI related to the laparoscopic procedure, only report one organ/space SSI.
- c. If an operative procedure is limited to a single breast and involves multiple incisions in that breast that become infected, only report a single SSI.
- d. In a colostomy formation or reversal (take down) procedure, the stoma and other abdominal incision sites are considered primary incisions. If both the stoma and another abdominal incision site develop superficial incisional SSI, report only as one SSI (SIP).

8. Attributing SSI to NHSN procedures that have secondary incision sites: Certain procedures can involve secondary incisions (i.e. BRST, CBGB, CEA, FUSN, PVBY, REC, and VSHN). The surveillance period for all secondary sites is 30 days, regardless of the required deep incisional or organ/space SSI surveillance period for the primary incision site(s) (see table above titled "Surveillance Period for Deep Incisional or Organ/Space SSI Following Selected NHSN Operative Procedure Categories"). Procedures meeting this designation are reported as only one operative procedure. For example:

- a. A saphenous vein harvest incision in a CBGB procedure is considered the secondary incision. One CBGB procedure is reported, the saphenous vein harvest site is monitored for 30 days after surgery for SSI, and the chest incision is monitored for 90 days. If the patient has a superficial infection of the leg site and a deep incisional SSI of the chest site two SSIs are reported.
- b. A tissue harvest site (e.g., Transverse Rectus Abdominis Myocutaneous [TRAM] flap) in a BRST procedure is considered the secondary incision site. One BRST procedure is reported, and if the secondary incision gets infected, reported as either SIS or DIS as appropriate.

9. SSI detected at another facility: It is required that if an SSI is detected at a facility other than the one in which the operation was performed, the IP of the index facility will be provided with enough detail so the infection can be reported to NHSN. When reporting the SSI, the index facility should indicate that Detected = RO (readmission to facility other than where procedure was performed).

10. SSI Attribution after - Multiple types of NHSN procedures are performed during a single trip to the OR: If more than one NHSN operative procedure category was performed through a single incision/laparoscopic sites during a single trip to the operating room attribute the SSI to the procedure that is thought to be associated with the infection. If it is not clear, as is often the case when the infection is an incisional SSI, use the NHSN Principal Operative Procedure Category Selection Lists to select the operative procedure to which the SSI should be attributed. For example, if a patient develops SSI after a single trip to the OR in which both a COLO and SB were

SURGICAL SITE INFECTION (SSI)

performed, and the source of the SSI is not apparent, assign the SSI to the COLO procedure.

- 11.SSI following invasive manipulation/accession of the operative site:** If during the post-operative period the surgical site has an invasive manipulation/accession for diagnostic or therapeutic purposes (e.g., needle aspiration accession of ventricular shunts, accession of breast expanders) and there is no evidence of an infection at this time, if an SSI develops following this manipulation/accession, the infection is not attributed to the operation. This reporting instruction does NOT apply to closed manipulation (e.g., closed reduction of a dislocated hip after an orthopedic procedure). Invasive manipulation does not include wound packing, or changing of wound packing materials as part of operative care.
- 12.Reporting instructions for specific post-operative infection scenarios:** An SSI that otherwise meets the NHSN definitions should be reported to NHSN without regard to postoperative accidents, falls, inappropriate showering or bathing practices, or other occurrences that may or may not be attributable to patients' intentional or unintentional postoperative actions. Also, SSI should also be reported regardless of the presence of certain skin conditions (e.g., dermatitis, blister, impetigo) that occur near an incision, and regardless of the possible occurrence of a "seeding" event from an unrelated procedure (e.g., dental work). This instruction concerning various postoperative circumstances is necessary to reduce subjectivity and data collection burden.

SURGICAL SITE INFECTION (SSI)

(Revised January 1, 2017)

Table NHSN Principal Operative Procedure Category Selection Lists
(The categories with the highest risk of SSI are listed before those with lower risks).

| Priority | Code | Abdominal Operations |
|----------|------|---|
| 1 | LTP | Liver transplant |
| 2 | COLO | Colon surgery |
| 3 | BILI | Bile duct, liver or pancreatic surgery |
| 4 | SB | Small bowel surgery |
| 5 | REC | Rectal surgery |
| 6 | KTP | Kidney transplant |
| 7 | GAST | Gastric surgery |
| 8 | AAA | Abdominal aortic aneurysm repair |
| 9 | HYST | Abdominal hysterectomy |
| 10 | CSEC | Cesarean section |
| 11 | XLAP | Laparotomy |
| 12 | APPY | Appendix surgery |
| 13 | HER | Herniorrhaphy |
| 14 | NEPH | Kidney surgery |
| 15 | VHYS | Vaginal Hysterectomy |
| 16 | SPLE | Spleen surgery |
| 17 | CHOL | Gall bladder surgery |
| 18 | OVRY | Ovarian surgery |
| Priority | Code | Thoracic Operations |
| 1 | HTP | Heart transplant |
| 2 | CBGB | Coronary artery bypass graft with donor incision(s) |
| 3 | CBGC | Coronary artery bypass graft, chest incision only |
| 4 | CARD | Cardiac surgery |
| 5 | THOR | Thoracic surgery |
| Priority | Code | Neurosurgical (Brain/Spine) Operations |
| 1 | VSHN | Ventricular shunt |
| 2 | CRAN | Craniotomy |
| 3 | FUSN | Spinal fusion |
| 4 | LAM | Laminectomy |
| Priority | Code | Neck Operations |
| 1 | NECK | Neck surgery |
| 2 | THYR | Thyroid and or parathyroid surgery |

DENOMINATOR REPORTING INSTRUCTIONS:*(Revised January 1, 2017)*

1. **Closure type:** Incisional closure type does not exclude a procedure from SSI surveillance. All otherwise eligible procedures are included in the denominator reporting, regardless of closure type. The closure technique is entered for each denominator for procedure. If a procedure has multiple incision sites and any of the incisions are closed primarily then the procedure is entered as a primary closure.

NOTE: When the patient returns to the OR within 24 hours of the end of the first procedure assign the surgical wound closure that applies when the patient leaves the OR from the first operative procedure.

2. **Wound class:** A high wound class is not exclusion for denominator reporting. If the procedure meets the definition of an NHSN operative procedure it should be reported in the denominator data regardless of wound class. NHSN will use the wound class for risk adjustment, as appropriate.
3. **Different operative procedure categories performed during same trip to the OR:**
If procedures in more than one NHSN operative procedure category are performed during the same trip to the operating room through the same or different incisions, a [Denominator for Procedure form](#) is reported for each NHSN operative procedure category being monitored. For example, if a CARD and CBGC are done through the same incision, a [Denominator for Procedure form](#) is reported for each. In another example, if following a motor vehicle accident, a patient has an open reduction of fracture (FX) and splenectomy (SPLE) performed during the same trip to the operating room and both procedure categories are being monitored, complete a [Denominator for Procedure form](#) for each.

EXCEPTION: If a patient has both a CBGC and CBGB during the same trip to the operating room, report only as a CBGB. Only report as a CBGC if there is only a chest incision. CBGB and CBGC are never reported for the same patient for the same trip to the operating room.

4. **Duration of the procedure when more than one category of NHSN operative procedure is performed through the same incision:** If more than one NHSN operative procedure category is performed through the same incision during the same trip to the operating room, record the combined duration of all procedures, which is the time from procedure/surgery start time to procedure/surgery finish time. For example, if a CBGC and a CARD are performed on a patient during the same trip to the operating room, the time from start time to finish time is reported for both operative procedures.
5. **Duration of Operative procedures if patient has two different NHSN operative procedures performed via separate incisions on the same trip to the OR:** try to determine the correct

SURGICAL SITE INFECTION (SSI)

duration for each separate procedure (if this is documented), otherwise, take the time for both procedures and split it evenly between the two.

6. **Same operative procedure category but different ICD-10 PCS or CPT codes during same trip to the OR:** If procedures of different ICD-10 PCS or CPT codes from the same NHSN operative procedure category are performed through the same incision/laparoscopic sites, record only one procedure for that category. For example, a facility is performing surveillance for CARD procedures. A patient undergoes a replacement of both the mitral and tricuspid valves during the same trip to the operating room. Complete one CARD Denominator for Procedure form because both procedures are in the same operative procedure category [CARD].
7. **For revision HPRO and KPRO procedures:** If total or partial revision HPRO or KPRO is performed, determine if any of the ICD-10 PCS/CM diagnosis or procedure codes indicating infection (below) were coded for that joint in the 90 days prior to and including the index HPRO or KPRO revision. If any of the specified codes are recorded, indicate on the denominator form that the revision was associated with 'prior infection at index joint'= YES. Note that the 'prior infection at index joint' variable only applies to *revision* HPRO and KPRO. The cases designated 'prior infection at index joint' = yes should be validated before the procedures is submitted to NHSN. This validation is necessary to ensure the code is aligned with the index joint revision. The ICD-10-PCS/CM code mapping guidance is found on the NHSN website in the SSI section under "Supporting Materials".
8. **Same NHSN operative procedure via separate incisions:** For operative procedures that can be performed via separate incisions during same trip to operating room (i.e., AMP, BRST, CEA, FUSN, FX, HER, HPRO, KPRO, LAM, NEPH, OVRY, PVBY), separate Denominator for Procedure forms are completed. To document the duration of the procedures, indicate the procedure/surgery start time to procedure/surgery finish time for each procedure separately or, alternatively, take the total time for the procedures and split it evenly between procedures.

Notes:

- A COLO procedure with a colostomy formation is entered as one COLO procedure.
- Laparoscopic hernia repairs are considered one procedure, regardless of the number of hernias that are repaired in that trip to the OR. In most cases, there will be only one incision time documented for this procedure. If more than one time is documented, total the durations. Open (i.e., non-laparoscopic) hernia repairs are reported as one procedure for each hernia repaired via a separate incision, (i.e., if two incisions are made to repair two defects), then two procedures will be reported. It is anticipated that separate incision times will be recorded for these procedures. If not, take the total time for both procedures and split it evenly between the two.

SURGICAL SITE INFECTION (SSI)

- 9. More than one operative procedure through same incision within 24 hours:** If a patient goes to the operating room more than once during the same admission and another procedure is performed through the same incision and the start time of the second procedure is within 24 hours of the finish time of the original operative incision, report only one [Denominator for Procedure](#) form for the original procedure, combining the durations for both procedures based on the procedure start times and finish times for both procedures. For example, a patient has a CBGB lasting 4 hours. He returns to the OR six hours later for another NHSN operative procedure via the same incision (e.g., CARD). The second operation has duration of 1.5 hours. Record the operative procedure as one CBGB and the duration of operation as 5 hour 30 minutes. If the wound class has changed, report the higher wound class. If the ASA class has changed, report the higher ASA class. Do not report the CARD procedure in your denominator data.

Note: When the patient returns to the OR within 24 hours of the end of the first procedure, assign the surgical wound closure technique that applies when the patient leaves the OR from the first operative procedure.

- 10. Patient expires in the OR:** If a patient expires in the operating room, do not complete a [Denominator for Procedure](#) form. This operative procedure is excluded from the denominator.
- 11. HYST or VHYS:** When assigning the correct ICD-10-PCS or CPT hysterectomy procedure codes, a medical record coder must determine what structures were detached and how they were detached based on the medical record documentation.
