Topic	2 4: Discrete Random Variables
4a	Identify the random variable in a probability experiment.
4b	Recognize and understand discrete probability distribution functions.
4c	Create a probability distribution for the values of a discrete random variable.
4d	Use a probability function to determine probabilities associated with a discrete random variable.
4e	Calculate and interpret the mean (expected value), variance, and standard deviation for discrete random variables and binomial probability distributions.
4f	Determine when a probability distribution should be classified as a discrete binomial probability distribution, and calculate probabilities associated with such a distribution.
	5: Continuous Random Variables and the Normal Distribution
5a	Recognize and understand continuous probability density functions.
5b	Use a probability density curve to describe a population, including a normal population.
5c	Calculate and interpret the area under a probability density curve.
5d	Calculate and interpret z-score, understanding the concept of "standardizing" data.
5e	Calculate and interpret z-scores using the Empirical Rule, understanding the general properties of the normal distribution: 100% is the total area under the curve, exactly 50% is to the left and right of the mean, and it is perfectly symmetric about the mean.
5f	Use technology to calculate the area under the curve for any normal distribution model: left, right, and between.
5g	Use technology to calculate percentiles, quartiles, and other numerical values of X for a specified area under a normal curve, including unusual values ( $P(X) < 5\%$ and $\mu \pm 2\sigma$ ).
Topi	6: The Central Limit Theorem
6a	Recognize the characteristics of the mean of sample means taken from different types of populations: normal and non-normal.
6b	Calculate the mean of sample means taken from different types of populations: normal and non-normal.
6c	Describe how the means of the samples calculated from a non-normal population might be distributed.
6d	Apply the Central Limit Theorem to normal and non-normal populations, and compute probabilities of a sample mean.
6e	Determine whether the Central Limit Theorem can be used for a given situation.
6f	Assess the impact of sample size on sampling variability.

bivariate data set.  Create a scatter plot and determine the type of relationship that exists between two variable: positive or negative correlation and weak or strong correlation.  Calculate and interpret the correlation coefficient using technology.  Calculate the line of best fit and interpret the coefficient using technology.  Use the line of best fit to make conclusions about the relationship between two variables, understanding correlation does not imply causation.  Calculate a residual using the line of best fit.  Use the p-value to determine if a line of best fit is statistically significant.  For a given value of x, find the appropriate estimated value of y.		
(error bound) and interval notation.	Topic	7: Confidence Intervals
Calculate the margin of error (error bound) using sample statistics.  Predict if a confidence interval will become wider or narrower given larger or smaller sample sizes as well as high or lower confidence levels.  Find the point estimate and margin of error (error bound) when given a confidence interval.  Estimate the sample size necessary to estimate a population mean.  Recognize the difference between the sample mean, x-bar, and the population mean, mu, as well as the difference between the sample standard deviation, s, and standard error of the mean, s/sqrt(n).  Find critical values for z_(a/2) and t_(a/2) given a value of a and degrees of freedom.  Estimate the sample size necessary to estimate a population proportion.  Topic 8: Hypothesis Testing  Determine the appropriate null and alternative hypotheses when presented with a problem.  Differentiate between Type I and Type II errors.  Understand and list the assumptions needed to conduct z-tests and t-tests.  Determine whether to reject or fail to reject the null hypothesis using the p-value method.  Determine if a test is left-tailed, right-tailed, or two-tailed.  Differentiate between independent group and matched pair sampling.  Calculate test statistics and p-values for hypotheses tests: single proportion, single mean, and difference between two means.  Accommodate the statistics and p-values for hypotheses tests: single proportion, single mean, and difference between two means.  Test hypotheses regarding the difference of two independent means (assume the variances are not pooled).  Draw conclusions and make inferences about claims based on hypotheses tests.  Topic 9: Linear Regression and Correlation  Differentiate between the independent (explanatory variable, x) and the dependent (response variable; positive or negative correlation and weak or strong correlation.  Differentiate between the independent fexplanatory variable, x) and the dependent (response variable; positive or negative correlation and weak or strong correlation.  Calculate and inte	7a	
Predict if a confidence interval will become wider or narrower given larger or smaller sample sizes as well as high or lower confidence levels.  Find the point estimate and margin of error (error bound) when given a confidence interval.  Estimate the sample size necessary to estimate a population mean.  Recognize the difference between the sample mean, x-bar, and the population mean, mu, as well as the difference between the sample standard deviation, s, and standard error of the mean, s/sqrt(n).  Find critical values for z _(α/2) and t _(α/2) given a value of α and degrees of freedom.  Estimate the sample size necessary to estimate a population proportion.  Topic 8: Hypothesis Testing  Betermine the appropriate null and alternative hypotheses when presented with a problem.  Differentiate between Type I and Type II errors.  Understand and list the assumptions needed to conduct z-tests and t-tests.  Determine whether to reject or fail to reject the null hypothesis using the p-value method.  Determine if a test is left-tailed, right-tailed, or two-tailed.  Differentiate between independent group and matched pair sampling.  Calculate test statistics and p-values for hypotheses tests: single proportion, single mean, and difference between two means.  Conduct hypotheses regarding the difference of two independent means (assume the variances are not pooled).  Topic 9: Linear Regression and Correlation  Differentiate between the independent (explanatory variable, x) and the dependent (response variable; p) in bivariate data set.  Topic 9: Linear Regression and correlation coefficient using technology.  Calculate and interpret the correlation coefficient using technology.  Use the line of best fit and interpret the coefficient using technology.  Use the line of best fit to make conclusions about the relationship between two variables, understanding correlation does not imply causation.  For a given value of x, find the appropriate estimated value of y.	7b	Calculate and interpret confidence intervals for estimating a population mean and a population proportion.
high or lower confidence levels.  7e Find the point estimate and margin of error (error bound) when given a confidence interval.  7f Estimate the sample size necessary to estimate a population mean.  8ecognize the difference between the sample mean, x-bar, and the population mean, mu, as well as the difference between the sample standard deviation, s, and standard error of the mean, s/sqrt(n).  7f Find critical values for z (α/2) and t (α/2) given a value of α and degrees of freedom.  7f Estimate the sample size necessary to estimate a population proportion.  7f Estimate the appropriate null and alternative hypotheses when presented with a problem.  8b Differentiate between Type I and Type II errors.  8c Understand and list the assumptions needed to conduct z-tests and t-tests.  8d Determine whether to reject or fail to reject the null hypothesis using the p-value method.  8e Determine if a test is left-tailed, right-tailed, or two-tailed.  8f Differentiate between independent group and matched pair sampling.  8a Calculate test statistics and p-values for hypotheses tests: single proportion, single mean, and difference between two means.  8b Conduct hypotheses tests for a single proportion and a single mean.  7c Test hypotheses regarding the difference of two independent means (assume the variances are not pooled).  8b Differentiate between the independent (explanatory variable, x) and the dependent (response variable, y) in bivariate data set.  8c Differentiate between the independent (explanatory variable, x) and the dependent (response variable, y) in bivariate data set.  8c Calculate and interpret the correlation coefficient using technology.  8c Calculate the line of best fit and interpret the coefficient using technology.  8c Calculate a residual using the line of best fit.  8d Calculate a residual using the line of best fit.  8d Use the p-value to determine if a line of best fit.  8d Use the p-value to determine if a line of best fit.	7c	Calculate the margin of error (error bound) using sample statistics.
Estimate the sample size necessary to estimate a population mean.  Recognize the difference between the sample mean, x-bar, and the population mean, mu, as well as the difference between the sample mean, x-bar, and the population mean, mu, as well as the difference between the sample standard deviation, s, and standard error of the mean, s/sqrt(n).  Find critical values for z_(α/2) and t_(α/2) given a value of α and degrees of freedom.  Estimate the sample size necessary to estimate a population proportion.  Topic 8: Hypothesis Testing  Ba Determine the appropriate null and alternative hypotheses when presented with a problem.  Differentiate between Type I and Type II errors.  Understand and list the assumptions needed to conduct z-tests and t-tests.  Determine whether to reject or fail to reject the null hypothesis using the p-value method.  Determine if a test is left-tailed, right-tailed, or two-tailed.  Differentiate between independent group and matched pair sampling.  Calculate test statistics and p-values for hypotheses tests: single proportion, single mean, and difference between two means.  Conduct hypotheses tests for a single proportion and a single mean.  Test hypotheses regarding the difference of two independent means (assume the variances are not pooled).  Draw conclusions and make inferences about claims based on hypotheses tests.  Topic 9: Linear Regression and Correlation  Differentiate between the independent (explanatory variable, x) and the dependent (response variable, y) in bivariate data set.  Create a scatter plot and determine the type of relationship that exists between two variable: positive or negative correlation and weak or strong correlation.  Calculate and interpret the correlation coefficient using technology.  Calculate the line of best fit to make conclusions about the relationship between two variables, understanding correlation does not imply causation.  Calculate a residual using the line of best fit.	7d	
Recognize the difference between the sample mean, x-bar, and the population mean, mu, as well as the difference between the sample standard deviation, s, and standard error of the mean, s/sqrt(n).  Find critical values for z (α/2) and t (α/2) given a value of α and degrees of freedom.  Find critical values for z (α/2) and t (α/2) given a value of α and degrees of freedom.  Find critical values for z (α/2) and t (α/2) given a value of α and degrees of freedom.  Find critical values for z (α/2) and t (α/2) given a value of α and degrees of freedom.  Find critical values for z (α/2) and t (α/2) given a value of α and degrees of freedom.  Find critical values for z (α/2) and t (α/2) given a value of α and degrees of freedom.  Find critical values for z (α/2) and t (α/2) given a value of α and degrees of freedom.  Find critical values for z (α/2) and t (α/2) given a value of α and degrees of freedom.  Find critical values for z (α/2) and t (α/2) given a value of α and degrees of freedom.  Find critical values for z (α/2) and t (α/2) given a value of α and degrees of freedom.  Find critical values for z (α/2) and t (α/2) given a value of α and degrees of freedom.  Find critical values for z (α/2) and t (α/2) given a value of α and degrees of freedom.  Find critical values for z (α/2) and t (α/2) given a value of α and degrees of freedom.  Find critical values for z (α/2) and t (α/2) given a value of α and degrees of freedom.  Find critical values for z (α/2) and t (α/2) given a value of α and degrees of freedom.  Find critical values for z (α/2) and t (α/2) given a value of α and degrees of freedom.  Find critical values for z (α/2) and t (α/2) given a value of α and degrees of freedom.  Find critical values for z (α/2) and t (α/2) given and t-tests and t-tests.  Find critical values for z (α/2) and t (α/2) given and t-tests and t-tests.  Find critical values for z (α/2) and t (α/2) given and t-tests and t-tests.  Find critical values for z (α/2) and t-tests and t-tests.  Find critical values for z (α/2) and t-tests	7e	Find the point estimate and margin of error (error bound) when given a confidence interval.
difference between the sample standard deviation, s, and standard error of the mean, s/sqrt(n). Find critical values for z_(α/2) and t_(α/2) given a value of α and degrees of freedom. Find critical values for z_(α/2) and t_(α/2) given a value of α and degrees of freedom. Find critical values for z_(α/2) and t_(α/2) given a value of α and degrees of freedom. Find critical values for z_(α/2) and t_(α/2) given a value of α and degrees of freedom. Find critical values for z_(α/2) and t_(α/2) given a value of α and degrees of freedom. Find critical values for z_(α/2) and t_(α/2) given a value of α and degrees of freedom. Find critical values for z_(α/2) and t_(α/2) given a value of α and degrees of freedom. Find critical values for sets in the value of α and degrees of freedom. Find critical values for sull the value of α and degrees of freedom. Find critical values for fail to reject the null hypothesis using the p-value method. Find critical value method. Find critical values for fail to reject the null hypothesis using the p-value method. Find critical value method. Find critical values for fail to reject the null hypothesis using the p-value method. Find critical value method. Find critical value for fail to reject the null hypothesis using the p-value method. Find critical value for fail to reject the null hypothesis using the p-value method. Find critical value for fail to reject the null hypothesis using the p-value method. Find critical value for fail to reject the null hypothesis using the p-value method. Find critical value for fail to reject the null hypothesis using the fail the value for fail to reject the null hypothesis using technology. Find critical value for fail to reject the null hypothesis using technology. Find critical value for fail to make conclusions about the relationship between two variables, understanding correlation does not imply causation. Find critical value of x, find the appropriate estimated value of y.	7f	Estimate the sample size necessary to estimate a population mean.
Find critical values for z_(α/2) and t_(α/2) given a value of α and degrees of freedom.  Fistimate the sample size necessary to estimate a population proportion.  Topic 8: Hypothesis Testing  Ba Determine the appropriate null and alternative hypotheses when presented with a problem.  Differentiate between Type I and Type II errors.  C Understand and list the assumptions needed to conduct z-tests and t-tests.  Determine whether to reject or fail to reject the null hypothesis using the p-value method. Calculate test statistics and p-values for hypotheses tests: single proportion, single mean, and difference between two means.  Conduct hypotheses tests for a single proportion and a single mean.  Test hypotheses regarding the difference of two independent means (assume the variances are not pooled).  Draw conclusions and make inferences about claims based on hypotheses tests.  Topic 9: Linear Regression and Correlation  Differentiate between the independent (explanatory variable, x) and the dependent (response variable, y) in bivariate data set.  Create a scatter plot and determine the type of relationship that exists between two variable: positive or negative correlation and weak or strong correlation.  Create a scatter plot and determine the type of relationship that exists between two variable: positive or negative correlation and weak or strong correlation.  Calculate and interpret the correlation coefficient using technology.  Use the line of best fit to make conclusions about the relationship between two variables, understanding correlation does not imply causation.  Calculate a residual using the line of best fit.  Substitute to determine if a line of best fit is statistically significant.	7g	
Estimate the sample size necessary to estimate a population proportion.  Fopic 8: Hypothesis Testing  Ba Determine the appropriate null and alternative hypotheses when presented with a problem.  Differentiate between Type I and Type II errors.  Understand and list the assumptions needed to conduct z-tests and t-tests.  Determine whether to reject or fail to reject the null hypothesis using the p-value method.  Determine if a test is left-tailed, right-tailed, or two-tailed.  Differentiate between independent group and matched pair sampling.  Calculate test statistics and p-values for hypotheses tests: single proportion, single mean, and difference between two means.  Conduct hypotheses tests for a single proportion and a single mean.  Test hypotheses regarding the difference of two independent means (assume the variances are not pooled).  Draw conclusions and make inferences about claims based on hypotheses tests.  Fopic 9: Linear Regression and Correlation  Differentiate between the independent (explanatory variable, x) and the dependent (response variable, y) in bivariate data set.  Create a scatter plot and determine the type of relationship that exists between two variable: positive or negative correlation and weak or strong correlation.  Calculate and interpret the correlation coefficient using technology.  Calculate the line of best fit and interpret the coefficient using technology.  Use the line of best fit to make conclusions about the relationship between two variables, understanding correlation does not imply causation.  Calculate a residual using the line of best fit.  Use the p-value to determine if a line of best fit is statistically significant.
