Stored Water vs. Natural Water Droughts

- **Stored water droughts** occur when large stores of water in man-made reservoirs, natural lakes, and groundwater aquifers depleted by very long, unusually low periods of precipitation.
- **Natural water droughts** quickly and fairly frequently follow just a few weeks or months of below-normal rainfall.

Source: National Drought Policy Commission Report (2000).

How Stored Water Droughts Happen

- People without enough stored water build reservoirs or tap into surface (natural lakes and streams) or groundwater (aquifers) storage.
- Reliable water supports population growth and more diverse water uses:
 - *Hydro-power dams create popular fishing and boating lakes and valuable lake view property.*
 - *Reservoir operating policies ensure minimum flows for fish and wastewater dilution when there would not otherwise be enough water in the stream.*
 - *Cities and farmers increase their withdrawals as they prosper and grow.*

Lake Sidney Lanier, Georgia

<http://www.greatlakesofgeorgia.com/lanier/>

How Stored Water Droughts Happen

- An unusually long dry period forces reservoir operators to draw down man-made lakes to
 - support withdrawals for cities and farms,
 - produce hydropower,
 - and keep enough water in navigation channels for barges to float.
- But
 - homes and businesses around the lake now have views of mud flats,
 - boat ramps no longer reach the water, and
 - lake fisheries suffer when releases are made for riverine species.

Water Disputes in the Southeast and Their Impact on Tennessee

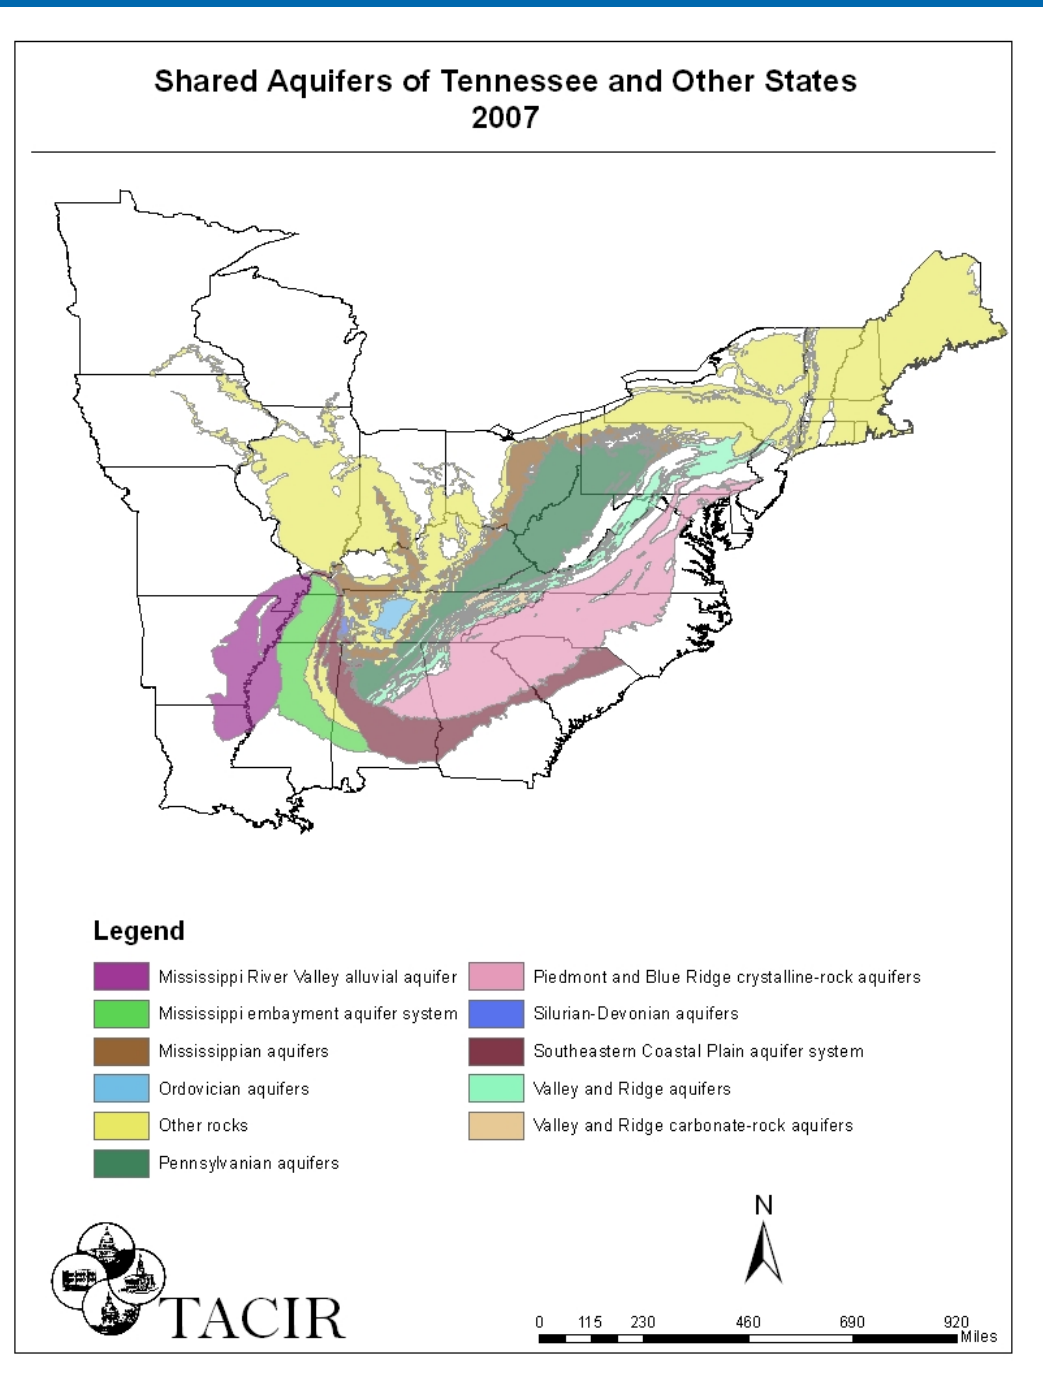

- *Growing competition by different users over the same surface and groundwater supplies is increasingly taking the form of “up” versus “downstream” use and dependence on water supply sources that extend over several jurisdictions and even states.*
- *Land use changes, population growth, rapid urbanization, and regional climate variation are imposing new, largely unanticipated pressures on the region’s water and reveal the impossibility of separating, and discretely managing, water supply and water quality.*
- *Protecting local water supplies and keeping them safe, clean, and available—while promoting economic growth—are proving to be difficult-to-reconcile goals in rapidly growing metropolitan areas and smaller communities that seek to broaden their tax base and economically diversify.*

Memphis and its Light, Gas & Water Division have been sued by the state of Mississippi. The lawsuit was filed in the U.S. Federal District in Oxford in February 2005. (The trial has been rescheduled for early next year according to the Commercial Appeal.)

Mississippi claims that one-third of the water Memphis pumps—about 60 million gallons a day—comes from south of the state line. This water is "unreasonably and unlawfully diverted," causing harm to the aquifer, it says.

Normandy Dam

TVA's Duck River "Balancing Act"

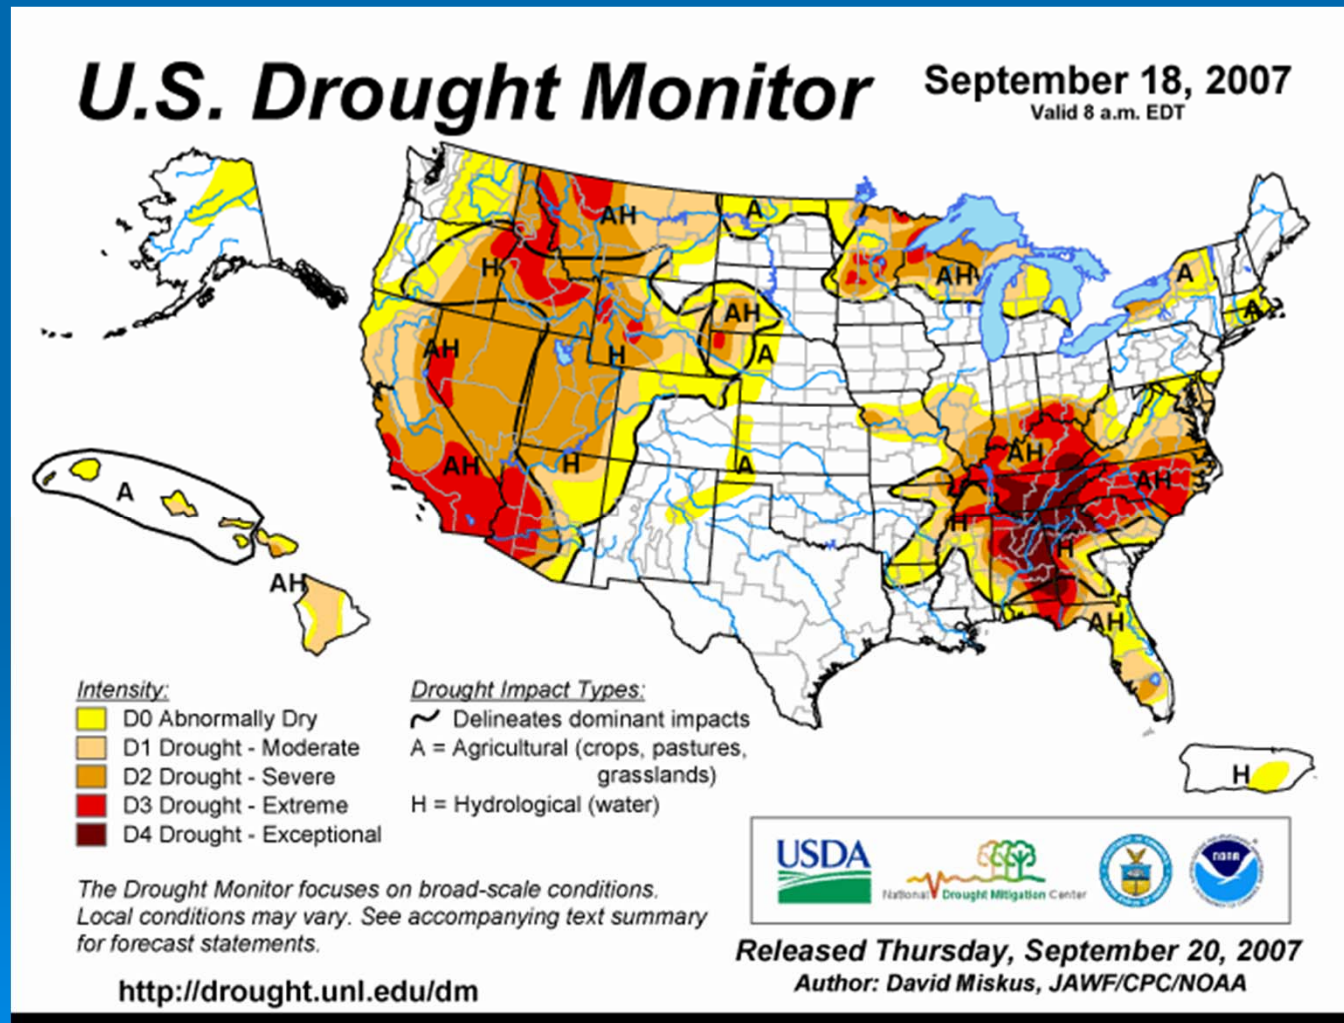

Normandy Reservoir is located on the Duck River in south central Tennessee. The 17-mile-long reservoir was completed in the 1970s to aid in the economic development of the upper Duck River region.

Dealing with Stored Water Droughts

No one can tell when it will rain enough to reverse this trend, so water deliveries have to be reduced, *but to whom first and by how much?*

- There may be a conflict between fairness and good economic policy in making water allocations.
- The newest water uses may generate more income and tax revenue than the oldest established uses.

Such conflicts are normally resolved on a case-by-case basis.

“Conflict, unlike any
we’ve seen before,
may soon be
facing our nation.”

Colonel Byron Jorns, USACE

Water Wars: The Need for a National Water Policy

30 March 2007

Water Resource Policy

Challenges

- Needs of Tennessee residents
 - Domestic consumption
 - Recreation
 - Power generation
- Needs of Business and Industry
 - Consumption
 - Navigation
 - Power generation
- Demands in other states that share watersheds

Managing competing interests!

Managing Water Resources

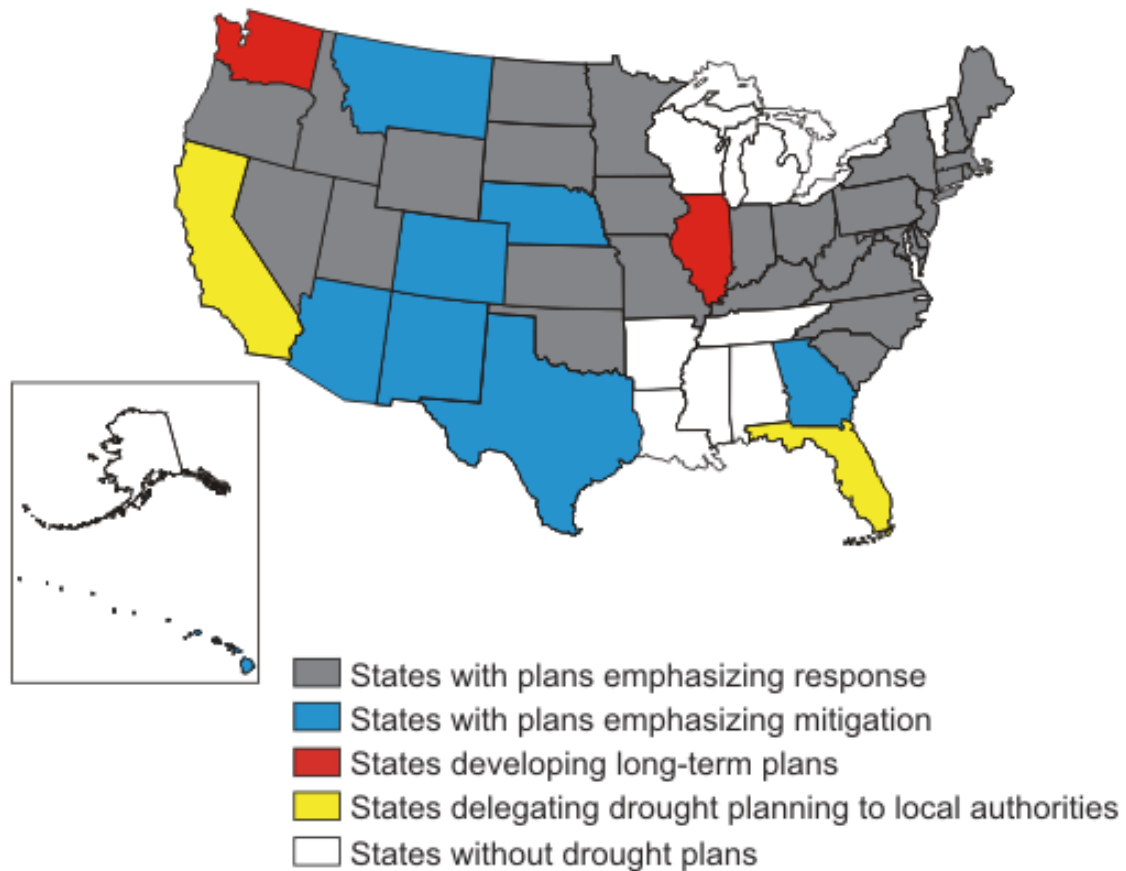

Complicating Factors

- Interests within and between states compete more and more for the same resource as we grow and develop
- State boundaries don't recognize watersheds
- Watersheds don't recognize state boundaries
- The weather doesn't always cooperate

“Development, management, and protection of water resources should be controlled by that level of government nearest the problem and most capable of effectively representing the vital interest involved.”

National Water Commission, 1973.

Status of Drought Planning October 2006
